## xtlang Types

|  |                              |
|--|------------------------------|
| Boolean  | i1                           |
| Boolean pointer  | i1*                          |
| Character  | i8                           |
| Strings (are null terminated)                                  | i8*                          |
| Integer  | i32                          |
| Integer pointer  | i32*                         |
| Long integer (default)   | i64                          |
| Long integer pointer   | i64*                         |
| 32 bit float   | float                        |
| 32 bit float pointer   | float*                       |
| 64 bit double (default)  | double                       |
| 64 bit double pointer  | double*                      |
| Variable a1 declared as pointer to double                      | a1:double*                   |
| C type void*   | i8*                          |
| Tuple of 2 i8's  | <i8, i8>                     |
| Pointer to tuple of double and i32                             | <double, i32>*               |
| Array of length and type                                       | length, type                 |
| Pointer to an array of 4 double                                | 4, double *                  |
| Vector of length and type                                      | /length, type/               |
| Pointer to a vector of 4 floats                                | /4,float/*                   |
| Closure  | [return type, arg type, ...] |
| Pointer to closure which takes 2 i32 arguments and returns i64 | [i64, i32, i32]*             |

\*\* is not a dereference operator, it is part of the type label.

## Custom xtlang Types

|  |                            |
|--|----------------------------|
| Define type for LLVM compiler.   | (bind-type name type)      |
| Tell pre-processor to textually substitute type for name before compiling. | (bind-alias name type)     |
| Define value.  | (bind-val name type value) |

## xtlang Coercion Functions

|                |                  |                |
|----------------|------------------|----------------|
| (i1toi64 i1)   | (i64tod i64)     | (ptrtoi64 ptr) |
| (i64toi1 i64)  | (dtoif64 double) | (dtof double)  |
| (ftoi64 float) | (i32toptr i32)   | etc.           |

## Common xtlang & Scheme

The following functions are available in both Scheme and xtlang and should follow R5RS, except as noted.

if  $c_1$  then  $e_2$  else  $e_3$  (if  $c_1$   $e_2$   $e_3$ )

Assign  $s_1 = e_1$ , eval expr (let ( ( $s_1$   $e_1$ ) ...) expr)

Sequence (begin

Boolean true #t

Boolean false #f

Boolean and (and  $n_1$   $n_2$  ...)

Boolean or (or  $n_1$   $n_2$  ...)

Boolean not (not  $o_1$ )

Anonymous function (lambda ( $a_1$  ...) expr)

Multiply (\*  $n_1$  ...)

Divide (/  $n_1$   $n_2$  ...)

Add (+  $n_1$  ...)

Subtract (-  $n_1$   $n_2$  ...)

Equality (=  $n_1$   $n_2$ )

Less Than (<  $n_1$   $n_2$ )

Greater Than (>  $n_1$   $n_2$ )

Not equal (<>  $n_1$   $n_2$ )

Remainder (modulo  $n_1$   $n_2$ )

Is null (null?  $n_1$ )

Assignment (set!  $s_1$   $e_1$ )

Loop (from common lisp) (dotimes ( $s_1$   $e_1$ ) expr)

Conditional (cond ( $c_1$   $e_2$ ) ... (else  $e_n$ ))

$a_x$  argument,  $c_x$  boolean expression,  $e_x$  general expression,  $n_x$  numeric expression,  $o_x$  object,  $s_x$  symbol

## xtlang Memory Allocation

|                     |   |
|---------------------|---|
| Allocate on stack.  | (salloc size)                                 |
| Allocate on heap.   | (halloc size)                                 |
| Create memory zone. | (memzone size ...)                            |
| Allocate in zone.   | (zalloc size)                                 |
| Push zone.          | (push_zone)                                   |
| Pop zone.           | (pop_zone)                                    |
| long int *a1 = 2;   | (let ((a1:i64* (salloc))) (pset! a1 0 2) ...) |
| int a1[4];          | (a1:i32* (zalloc 4))                          |

## xtlang Pointers & Aggregates

|                     |   |
|---------------------|---|
| Dereference pointer | (pref ptr <sub>1</sub> offset <sub>1</sub> )        |
| Dereference tuple   | (tref ptr <sub>1</sub> offset <sub>1</sub> )        |
| Dereference array   | (aref ptr <sub>1</sub> offset <sub>1</sub> )        |
| Dereference vector  | (vref ptr <sub>1</sub> offset <sub>1</sub> )        |
| Set pointer         | (pset! ptr <sub>1</sub> offset <sub>1</sub> $p_1$ ) |
| Set tuple           | (tset! ptr <sub>1</sub> offset <sub>1</sub> $t_1$ ) |

|                     |   |
|---------------------|---|
| Set array           | (aset! ptr <sub>1</sub> offset <sub>1</sub> $a_1$ ) |
| Set vector          | (vset! ptr <sub>1</sub> offset <sub>1</sub> $v_1$ ) |
| Fill pointer        | (pfill! ptr <sub>1</sub> $e_1$ , ... $e_n$ )        |
| Fill tuple          | (tfill! ptr <sub>1</sub> $e_1$ , ... $e_n$ )        |
| Fill array          | (afill! ptr <sub>1</sub> $e_1$ , ... $e_n$ )        |
| Fill vector         | (vfill! ptr <sub>1</sub> $e_1$ , ... $e_n$ )        |
| Get address pointer | (pref-ptr ptr <sub>1</sub> offset <sub>1</sub> )    |
| Get address tuple   | (tref-ptr ptr <sub>1</sub> offset <sub>1</sub> )    |
| Get address array   | (aref-ptr ptr <sub>1</sub> offset <sub>1</sub> )    |
| Get address vector  | (vref-ptr ptr <sub>1</sub> offset <sub>1</sub> )    |

$a_x$  array.  $ptr_x$  i1\*, i8\*, i16\*, i32\*, float\*, double\* pointers. offset<sub>x</sub> natural number.  $e_x$  expression.  $n_x$  float, double, i1, i8, i32, i64 expression.  $t_x$  tuple.  $v_x$  vector.

## xtlang Core Functions

|  |  |
|--|--|
| Uses boost random() or C rand() [0.0..1.0] | double (random)                              |
|  | (begin $e_1$ $e_2$ ...)                      |
|  | null   |
|  | (now)  |
| void                                       | (lambdas ?)                                  |
|  | (lambdaz ?)                                  |
|  | (lambdah ?)                                  |
|  | (printf format:i8* $e_1$ $e_2$ ...)          |
|  | (sprintf str:i8* format:i8* $e_1$ $e_2$ ...) |
| Callback                                   | (callback time name args ...)                |
| Schedule (same as callback)                | (schedule time name args ...)                |
| cast   bitcast                             | (bitcast ?)                                  |
| convert   bitconvert                       | (bitconvert ?)                               |
| &   bitwise-and                            | (bitwise-and $n_1$ $n_2$ ...)                |
| bor   bitwise-or                           | (bitwise-or $n_1$ $n_2$ ...)                 |
| ^   bitwise-eor                            | (bitwise-eor $n_1$ $n_2$ ...)                |
| <<   bitwise-shift-left                    | (bitwise-shift-left $n_1$ $n_2$ )            |
| >>   bitwise-shift-right                   | (bitwise-shift-right $n_1$ $n_2$ )           |
| ~   bitwise-not                            | (bitwise-not $n_1$ )                         |

$e_x$  expression,  $n_x$  float, double, i1, i8, i32, i64 expression

## Extempore Scheme

Originally from TinyScheme v1.35. Implements most of R5RS except macro, which is a common lisp style macro.

## Time

|                  |          |
|------------------|----------|
| Now.             | (now)    |
| Second constant. | *second* |
| Minute constant. | *minute* |

Hour constant.

\*hour\*

$r_x$  double or float. Return type same as args, except as noted.

## General Functions

## Function Name Conventions

'!' at end of name indicates function is destructive (e.g. mutates the arguments passed to it).  
'\_c' at end of name indicates an xtlang closure.  
'-' minus sign separator denotes Scheme name.  
'\_' underscore separator denotes xtlang name.  
'\*' on both ends of variable denotes global scope.  
'?' at the end of name denotes function returns boolean.

Color denotes xtlang type.

Color denotes xtlang only verb.

Color denotes scheme only verb.

Color denotes common xtlang and Scheme verb.
